MOHICAN VINYL WINDOWS

Type: ROUTINE INSPECTION

Date: 11-APR-2016

2.40(a)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Dog #224, a female golden retriever was noticed to have puncture wounds on the left shoulder and face area. The area appeared to have been shaved and cleaned recently. However, the wounds were not fully healed and there was an odor present indicating possible infection. The Licensee stated that this dog had recently been in a fight about two weeks ago. He informed inspectors that he had called the Attending Veterinarian's clinic and was advised to treat the animal with Amoxicillin. There was no documentation of the injury or written treatment plan at the facility at the time of inspection. The inspectors were able to make contact with the individual from the clinic that prescribed the treatment. Inspectors were informed that the treatment advised for this dog was Cephalexin 2 times a day, as well as a topical treatment at least once a day. This treatment was to be provided to this dog for one week. If the wounds were not healed or the injury worsened, the Licensee was instructed to have the dog examined by the clinic. Although the Licensee has been treating this animal with Amoxicillin for over one week, the issue is not resolved and the Licensee has not had this dog examined by a Licensed Veterinarian. Failure to follow the guidance by the Attending veterinarian can result in prolonged illness or injury that could be prevented with appropriate treatment. The attending veterinarian must have the authority to ensure the provision of adequate veterinarian care for the facility.

Correct from this day forward.

2.40(b)(2)

REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Dog #105 a female Yorkie was noticed with several areas of hair loss and skin swelling on the back and shoulders, and an ulcerated and swollen area on the left front foot. The licensee stated that this animal has had ongoing issues with skin problems that were previously documented by the attending veterinarian; however, the licensee could not provide any record of this dog having its skin condition diagnosed or any treatment plan documented. When inspectors contacted the attending veterinarian's office for more information, there was no medical record for this dog having been diagnosed for skin issues or any treatment advised. This animal must be examined by a licensed veterinarian and documentation must be kept recording the diagnosis, treatment, and any other ongoing problems associated with this condition for inspectors to review in the future.

Inspection Report

Dog #224, a female golden retriever, has continuing need of veterinary care as a result of a dog fight. The licensee has been providing treatment, but the antibiotic is different from that advised, and treatment has continued longer than initially recommended before having the dog examined by a veterinarian. This animal appears to have unresolved infection, given the appearance and odor of the wounds. This dog must be examined by a licensed veterinarian and documentation must be kept recording the diagnosis, treatment, and any other ongoing problems associated with this condition for inspectors to review in the future.

Appropriate methods must be used to prevent, control, diagnose, and treat diseases and injuries to ensure provision of adequate veterinary care.

Dog with USDA tag #144 (female golden retriever) that was cited on the last routine inspection was seen by a Licensed veterinarian and treated as directed.

2.40(b)(3)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

There were two dogs documented on today's report as being in need of Veterinary care. The Licensee was aware of the dogs' conditions. However; there was no documentation of ongoing treatment and these issues have not been resolved. There has been a clear lack of communication with the attending veterinarian regarding the duration and method of treatment for the conditions of these dogs. Correct by ensuring that there is a mechanism of direct and frequent communication so that timely and accurate information on animal health are conveyed to the attending veterinarian.

Correct From this day forward

2.50(a)(1)

TIME AND METHOD OF IDENTIFICATION.

There are currently 3 shihtzu females born at the facility on 11/14/2015 that do not currently have a tag, microchip, tattoo or any other acceptable form of ID for adult dogs. Identification of dogs is required to facilitate inspection, recordkeeping and tracking animal movement. All dogs that are 16 weeks or older must have an appropriate ID. In addition all adult dogs must have one uniform method of identification for the facility to facilitate inspection, records keeping and tracking all animal movement.
